### DESCRIPTION

#### Surface Preparation

DOWSIL™ 90-006-2 RF Aerospace Sealant adheres well to primed surfaces, typical materials include glass, cured silicone rubber, cork, phenolic, polyester, epoxy, silicone resin laminates and most metals including stainless steel, titanium and aluminum.

It may not adhere well to polyethylene or certain plastics and organic materials (including rubber), which bleed or exude plasticizers.

Stronger and more uniform bonds are obtained by preparing metal and plastic surfaces with DOWSIL™ PR-1200 RTV Prime Coat.

For best results:

1. Clean the surface with a chlorinated solvent (see Handling Precautions) and a slightly abrasive pad or a coarse lint-free cloth.
2. Rinse cleaned surface with acetone or methyl ethyl ketone.
3. Apply a thin coat of primer by dipping, brushing or spraying.
4. Allow the primer to dry for at least 1 hour, according to relative humidity.
5. Silicone rubber surfaces should not normally be primed, but only roughened slightly with abrasive paper and rinsed with acetone. In thin sections, a primer may be needed.

#### Mixing

DOWSIL™ 90-006-2 RF Catalyst is added in a ratio of 1 part to 10 parts DOWSIL™ 90-006-2 RF Base, by weight. It may be dispersed by 2 to 5 minutes of hand mixing, or by approximately 40 cycles of a mechanical mixer. The base and catalyst are supplied in contrasting colors: when uniformity of color is achieved, components are uniformly blended.

#### How to Apply

After being catalyzed DOWSIL 90-006-2 RF Aerospace Sealant may be applied with a spatula. It can also be loaded into a cartridge and applied from a pressure gun. Uncured excess may be removed with xylene, toluene or similar aromatic solvents.

#### Working and Cure Time

DOWSIL 90-006-2 RF Aerospace Sealant is useable for a minimum of 2 hours after catalyst addition, unless otherwise specified.
